DETAILED ACTION

Specification

The application has not been checked to the extent necessary to determine the presence of all possible typographical and grammatical errors. Applicant's cooperation is requested in correcting any errors of which he/she may become aware in the application.

The Information Disclosure Statements filed 03/19/04 have been considered.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Bock (US 6, 707, 410) in view of Bidermann et al (US 6, 788, 237).

Bock teaches in figure (3) a machine for time-to-threshold analog-to-digital conversion in an imaging system comprising: a threshold detector including a first input transistor having a first gate (See column 7, line 15)' a second input transistor having a second gate (See column 7, line 18), means for applying an analog input to said first gate and said second gate (See column 7, lines 22-25).

Bock does not specifically teach applying a sensor output to the transistors as the analog input signal. However, Bidermann et al teach analog-to-digital conversion for digital pixel sensors wherein the output of a sensor

(photodiode) is connected to the input of two transistors (See Column 7, lines 35-38). It would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teachings of Bidermann et al into the system of Bock to improve system performance and reliability because this would result in a shared ADC architecture in a digital pixel sensor while still permitting the digital image sensor to practice multiple sampling for enhancing the dynamic range of the image sensor (See column 4, lines 49-52).

Allowable Subject Matter

Claims 2-13 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claims 14-20 are allowable.
